ASSESSMENT	Mini Assessment — Prompt Engineering Workflow

01 | Project Idea

What it does	TripWise AI turns a traveller's raw plans into a usable journey blueprint. It considers where the person is going, how long they have, what they can spend, what they enjoy and how they prefer to travel.
Why it matters	Travel planning becomes difficult when many choices must be handled together. The proposed prompt workflow separates the decision-making into smaller stages so that each response becomes useful context for the next stage.

02 | Aim of the Workflow

The goal is to create a travel-planning assistant that first understands the traveller, then narrows down choices, builds a schedule, adds practical preparation information and finally checks whether the result actually fits the original requirements. The process is designed to be iterative rather than a single large prompt.

03 | Decision Pipeline

TRAVELLER DATA	PROFILE	OPTIONS	PLAN	CHECK	REFINED TRIP

04 | Core Modules

A. Traveller Profile	Collect destination, dates, budget, number of travellers, interests, accommodation style, mobility preferences and restrictions. Convert these details into a compact planning profile.
B. Smart Choice Filtering	Use the profile to shortlist attractions, activities, food experiences and nearby places. Give priority to options that fit time, cost and personal interests instead of producing an unfiltered list.
C. Schedule Builder	Turn the selected options into a sensible daily sequence. Keep nearby activities together, leave space for meals and breaks, and avoid packing too many activities into one day.
D. Practical Trip Kit	Create supporting information such as a packing list, document reminders, local transport notes, reservation reminders and a simple spending estimate.
E. Quality Check & Revision	Compare the finished plan with the original constraints. Detect excessive travel, unrealistic timing, budget pressure or mismatched activities, then revise the weak parts.

05 | Prompt Architecture

Prompt 1 — Discover	Ask the AI to interpret the traveller's requirements and create a structured profile. Missing details should be flagged instead of guessed.
Prompt 2 — Recommend	Pass the profile forward and request a ranked set of suitable experiences. The AI should justify the recommendations using the traveller's priorities.
Prompt 3 — Organize	Feed the selected experiences into a scheduling prompt. The output should form a realistic sequence with travel gaps, rest periods and time-aware grouping.
Prompt 4 — Prepare	Use the itinerary as context for generating practical trip preparation material and an approximate spending breakdown.
Prompt 5 — Improve	Give the AI the original requirements and current plan again. Ask it to locate weaknesses, explain the problems and produce a revised version.

06 | Context Flow

The workflow is connected through context. Instead of treating every prompt independently, each stage receives the useful result from the previous stage. This reduces repetition and allows later decisions to remain consistent with earlier constraints.

STAGE	USES	CREATES
01	Traveller information	Planning profile
02	Planning profile	Ranked experience list
03	Experience list + trip limits	Daily schedule
04	Daily schedule	Preparation pack
05	Complete plan + constraints	Revised itinerary

07 | Example Scenario

A pair of travellers is planning a four-day Bengaluru visit. Their spending limit is ₹15,000 and they want a mix of technology, regional food and heritage experiences without making the trip exhausting. Public transport is preferred whenever it is convenient.

08 | Intended Response

TRIP PROFILE	RECOMMENDATIONS	DAILY PLAN
Constraints, interests and travel style	Prioritized places and activities with reasons	Time-balanced sequence with practical movement
PREPARATION	BUDGET VIEW	REVISION
Documents, packing and reminders	Approximate cost categories	Problems found and corrected

09 | Sample Journey Blueprint

DAY	THEME	PLAN STYLE	CHECKPOINT
01	Heritage + Food	One major heritage stop paired with a nearby food experience.	Travel time + spending
02	Technology	Technology-focused visit followed by nearby low-effort sightseeing.	Energy level
03	Culture + Cuisine	Local food exploration combined with cultural locations.	Budget remaining
04	Leisure + Return	Relaxed activity, optional shopping and return preparation.	Final checklist

10 | Evaluation Criteria

Relevance	Does each recommendation connect to the traveller's interests and stated priorities?
Feasibility	Can the schedule realistically be completed with available time and transport?
Budget Fit	Does the plan respect the spending limit and highlight likely cost areas?
Consistency	Do later stages preserve the constraints established at the beginning?
Adaptability	Can the itinerary be modified when the traveller changes a requirement?

11 | Advantages of the Approach

- Breaks a complex travel task into manageable reasoning stages.
- Keeps recommendations connected to the traveller's original requirements.
- Produces both planning content and practical preparation support.
- Makes it easier to identify unrealistic schedules before finalizing the trip.
- Can be reused for different destinations, budgets and traveller profiles.

12 | Conclusion

TripWise AI presents prompt engineering as a structured planning method rather than a one-shot question-and-answer system. By carrying useful context from traveller discovery through recommendation, scheduling, preparation and review, the approach can produce travel plans that are more coherent, practical and easier to refine.
